

HIGH-TRACTION-WHEELS

FOR CAMERA CARRIAGES AND REHAB ROBOTS

When the going gets tough ...

Challenging pipeline configurations and conditions can make life tough for operators of sewer inspection and rehabilitation equipment. Various factors, such as excessive supply cable length, slippery surfaces and heavy fouling, can prevent the CCTV or rehab system from moving forward through the line. The solution to the problem: high-traction wheels with tungsten carbide grit facing, custom designed for the vehicle at hand and available in **steel** and **stainless steel designs**. They work very much like studded snow chains used on automotive tires. The carbide facing has a hard, rough surface which dramatically increases wheel traction. **Five different carbide grit sizes** can be selected as required to provide optimized wheels for specific pipe surfaces and applications.

We offer:

- **Construction and production of new wheels**
- **Tungsten carbide facing of blanks**
- **Refacing of used wheels**

Warning: Grit-faced wheels may cause surface damage to pipe walls and CIPP liners.
Use at your own risk!
